Water Testing

Frequently Requested :

- Coliform Bacteria
- Nitrate
- Arsenic
- Lead
- Metals

WHY TEST?

COLIFORM BACTERIA

It is recommended to test your water annually. It's also recommended if a new well has been constructed, recent work has been done on the well, or if you suspect any contamination has occurred.

NITRATE

Nitrate has health concerns for all ages, so it is recommended to get this tested once every 1-2 years. It should be done annually if your house has pregnant women, women who want to become pregnant, or young children.

ARSENIC

It is recommended once every 10-15 years

LEAD

It is recommended for homes older than 1985 because Lead was a component of plumbing solder that was used in homes with copper plumbing installed before 1985.

METALS

It is recommended to test this at least once and/or if there is odor or color in your water.
